Total Cost: 1176  $\in$  + Cost of opencr board and all plastic (incl. tb3 structure) and scrwes TODO:

- 1. Abmessungen von einer struckture layer
- 2. upboard1-link noch eintragen

#### 2 Simulation

#### 2.1 Launch

These files are executed one after another:

- 1. bb simulation: ballbot.launch
- 2. bb\_description: bb\_description.launch
- 3. bb\_description -> urdf: bb.xacro
- 4. bb description -> urdf: bb.urdf.xacro
- 5. bb description -> urdf: common properties.xacro
- 6. bb description -> urdf: bb.gazebo.xacro

### 2.2 Simulation design

Ballbot SDF Reference: Ballbotmodel

We use not the sdf but the xacro description as in this example here.

Gazebo uses different physics engines:

- Open Dynamics Engine (ODE) (Default)
- Bullet
- Dynamic Animation and Robotics Toolkit (DART)
- Simbody

which all have different friction etc. models.

Files:

• bb.urdf.xacro: Link's: Visual description of the Robot and its collision model(STL file). Pose Mass and Inertias. Joint's: Pose, axis, effort and velocity limits, friction.

- common\_properties.xacro: Macros for color definition.
- bb.gazebo.xacro: gazebo references dynamics of the links: friction parameters (mu1,mu2),

#### Gazebo Parameter's List:

name(xacro)	description	value	sdf group		
mu1	is the Coulomb friction coefficient for the first friction direction	1.0	ode		
mu2	is the friction coefficient for the second friction direction (perpendicular to the first friction direction)	2.0	ode		
kp	spring constant equivalents of a contact as a function of SurfaceParams::cfm and SurfaceParams::erp		ode		
kd	spring damping constant equivalents of a contact as a function of SurfaceParams::cfm and SurfaceParams::erp.		ode		
$\operatorname{cfm}$	Constraint Force Mixing parameter.		ode		
erp	Error Reduction Parameter.		ode		
$\min_{\text{depth}}$	Minimum depth before ERP takes effect.		ode		
max_Vel	Maximum interpenetration error correction velocity. If set to 0, two objects interpenetrating each other will not be pushed apart.		ode		
slip1	Artificial contact slip in the primary friction direction		ode		
slip2	Artificial contact slip in the secondary friction direction.		ode		
See: ODESurfaceParams					

## 2.3 Gazebo Parameters

#### 2.4 Control

sobald diff drive plugin angeschaltet drehen sich die raeder viel zu schnell ....

## 2.4.1 Plugins

- $\bullet$  gazebo-ros-control
- $\bullet$  diff drive

## 2.4.2 Launch

#### roslaunch rrbot\_control rrbot\_control.launch

These files are executed one after another:

- 1. load config
- 2. controller\_spawner

# 2.5 Sensors

## $2.5.1~\mathrm{IMU}$

We want to simulate the IMU of the opencr board. STRG+T to see imu topic values! Imu of opencr board simulated

Simulate like this: rviz rviz dann als fixed frame nimm: imu\_link. Und add topic imu und waehle als topic ballbot/sensor/imu

bbbb

# 3 Model

# 3.1 Composition

The Ballbot consists of three parts, which are depicted in Figure 3.1.

- Body with motors
- ullet 3 omni-directional wheels
- Ball

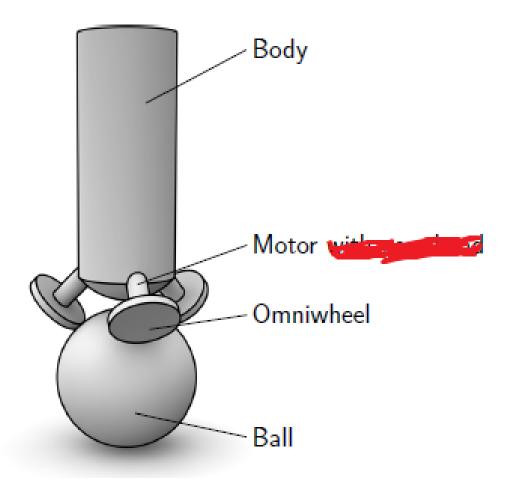

Abbildung 3.1: Parts for the 3D-Model

name	Mass [kg]	inertia	pic	Translation from basis point to na-
				me
Upstructure (all except wheels)	1.557	$i_{xx} = ??$		$\mathbf{x}$ =
		$i_{yy} = ??$		$\mathbf{y}=$
		$i_{zz} = ??$		z=
		$i_{xy} = ??$		
		$i_{zy} = ??$		
		$i_{xz} = ??$		

# 3.2 Assumptions

To reduce the complexity of the system, the following assumptions are made:

- No slip between the contact points between the ball/ground and wheels/ball
- No friction; except the friction, which occurs at the rotation of the ball around the z-axis
- No deformation
- Fast motor dynamics; The controlling of the motor is much faster than the controller of the Ballbot
- Ball moves only horizontal

# 3.3 Dynamic
